

Figure 5 illustrates an intermediary directory maintained by an intermediary, seen as it opens in the user's equipment, 50. In the intermediary directory, there is represented the intermediary's name 51 and the user's name 52. Information of received link addresses is represented as rows in the same fashion as in known email directories. As regards the received links, there are represented, in respective columns, the transmitter, the subject, the link and the date of the transmission. The opening of a received file is carried out by activating the desired link. The link address as such does not have to be represented in the user's directory, but the file can be opened for example by activating the 'subject' of the desired link, in which case the file is looked up on the basis of the recorded link address.--.

---

IN THE CLAIMS:

Amend claim 12 as follows:

--12. (amended) An arrangement according to claim 11, characterized in that said arrangement comprises means for creating two intermediary directories for one user, means for establishing a connection between the user and the first intermediary directory on the basis of a first verification of the user, and means for establishing a connection between the user and the second intermediary directory on the basis of a second verification of the user, in which case the first and second verification are mutually different as regards the reliability (strength) typical of the verification procedure.--
